

- This gesture-based recognition system uses the Google MediaPipe model.
- As suggested by Prof. Thiago, I began by converting the code to JavaScript and integrating p5.js artwork.
- One major challenge was getting the code to run locally. While the model worked well on Google Colab, running it locally was a different issue.
- With the help of my friends, we were eventually able to resolve the local setup problem after several attempts.
- Adding the interactive element (such as detecting a thumbs-up gesture) was relatively straightforward once the model was working.

Next Steps:

- Implement additional gesture recognition.
- Create a sequence-based interaction where the system prompts the user with gestures and recognizes the responses as inputs.
